Introduction

Illinois Landfill Projections of Disposal Capacity is the Illinois Environmental Protection Agency's annual report regarding the expected disposal capacity available for municipal waste at Illinois landfills. Illinois municipal waste landfills are required to report to the Illinois EPA the quantities of solid waste they receive each year, and to calculate and report the amount of remaining capacity existing on the first day of the following year.

The Illinois Solid Waste Management Act requires the Illinois EPA to publish this report and to present the data on a regional basis. For this report, the Illinois EPA utilizes its seven administrative regions.

During calendar year 2013, 42 landfills reported receiving 45,094,197 gate cubic yards of waste and a combined capacity of 947,107,568 gate cubic yards. Dividing waste disposed during 2013 by remaining capacity reported on January 1, 2014, indicates a statewide landfill life expectancy of 21 years at current disposal rates.

Landfill capacity, however, is subject to adjustments due to changes in waste generation rates, landfill expansions, and new landfills.

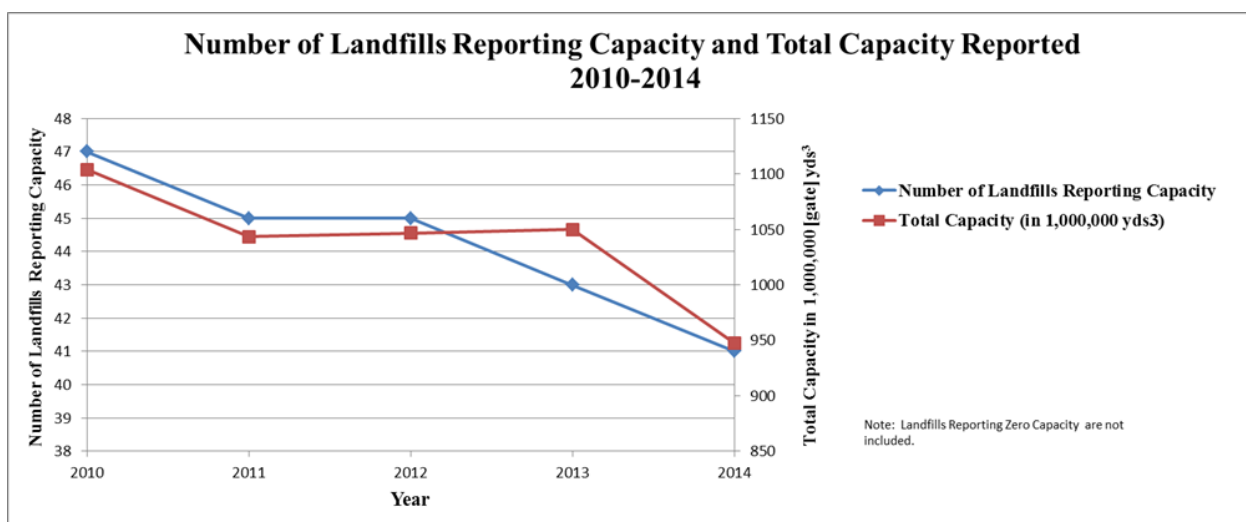

The Illinois regions range from a low of 11 years of current landfill life in Region 2, to a high of 50 years of landfill life in Region 7. See Table 1.

Illinois Landfills: Remaining Capacities as of January 1, 2014

¹ Landfill life (in years) means remaining capacity divided by waste disposed. This indicates how long a region may be served by local landfills at current disposal rates, barring capacity adjustments, until capacity is depleted.

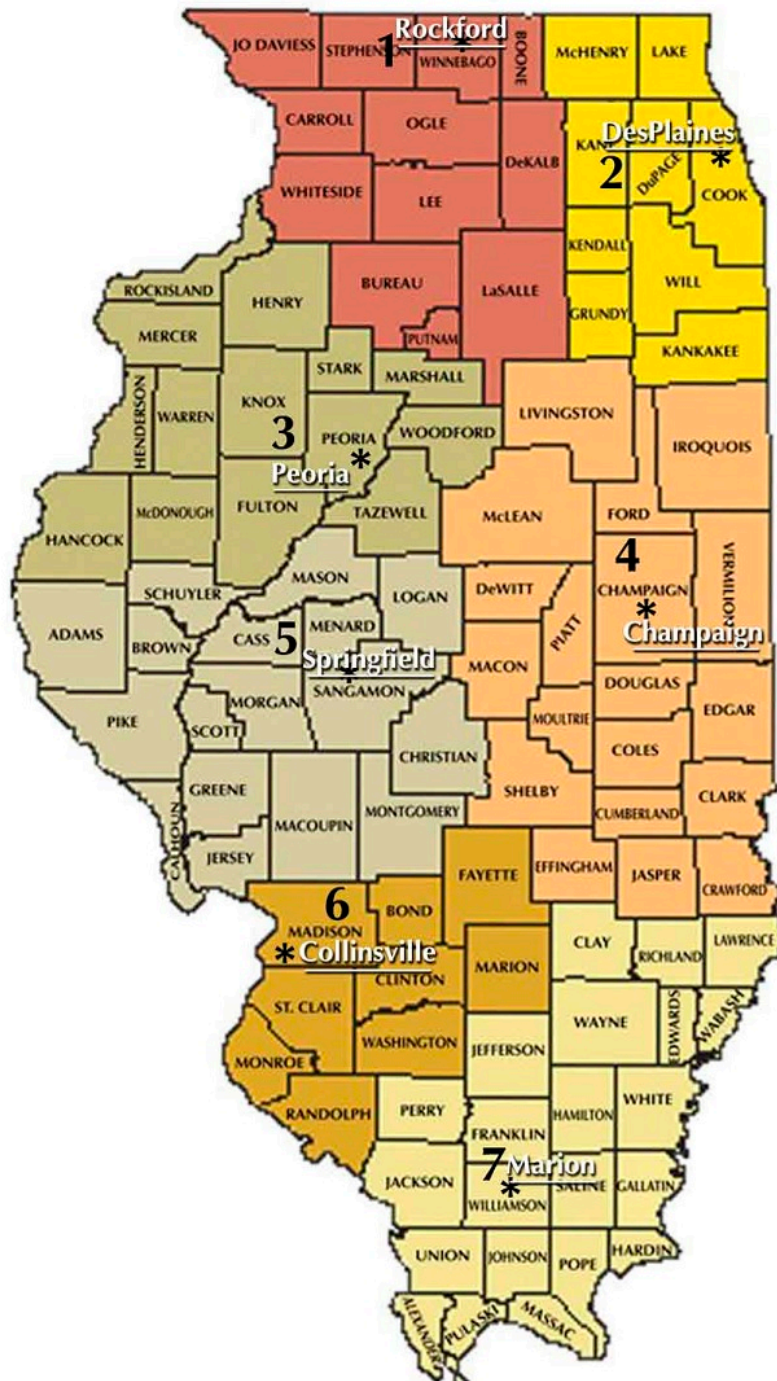

² The Landfill Life Totals value is derived by dividing the total reported capacity by the total amount of waste accepted during the same time period.
